

PLT Auto Logout 2.0

The PLT Auto Logout program is used to automatically log out all users of an operating system at a specific time. In the program configuration a time can be set so that the system forces all users to log off. In connection with our Plant Backup System for example can Composer-Server and Composer-Clients be setup to ensure successful backup routines.

The program runs in the background and can be opened by selecting the icon on the task bar next to the desktop clock. Before the system logs the users off a warning window appears with a count down. This countdown time can be set in the program configuration and varies from 5-30 minutes. The program cannot be configured by multiple users at the same time, each subsequent user past the first will receive a warning window.

The Auto Logout program from PLT Automation S.à.r.l. was designed for use under Windows 2000 Server, Windows 2000 Professional, Windows 2003 Server, Windows XP Professional, Windows Server 2008 and Windows 7 Professional.

Auto Logout can be setup so that the users receive a warning to save open documents (only set the timer to active) or if selected it forces the logoff with out the warning.
